Shines bright – sets right.

Practice trends we're seeing

Is your handpiece underperforming, or warning you?

A handpiece that feels hotter, louder or less precise is not always just ageing equipment. With updated reprocessing requirements under AS 5369:2023 more practices are rethinking how their handpieces are serviced and maintained.

- A 2024 JADA review reported 1,000+ burn cases linked to overheating handpieces over a 10 year-period
- Study analysed cleaning outcomes from 4,830+ instruments

It is one reason genuine parts and qualified servicing are increasingly being viewed as part of good clinical governance, patient safety, and not just equipment upkeep.
