

# ADVANCEMENTS in **Endodontic** Technology

Dr James Wealleans

This course will discuss advancements in NiTi metallurgy, with a focus on the heat treatment process.

Heat treatment of NiTi results in a more flexible file which is able to preserve dentin, respect canal anatomy, and reduce file separation.

In addition, viewers will be introduced to Brasseler range of bioceramic products which are ideal for Endodontic surgical applications, perforation repairs, and the single-cone obturation method.

Bioceramics are easy to use as they come premixed, are non-staining, biocompatible, remain structurally stable, and are highly antibacterial.
